

Freestep

Lightness feeling and stability

This alpine snowshoe is perfect for reaching summits. The Natural Step (see previous page) is associated to "metallic saws" or harsh irons and a light double ribbed frame ("perimetric frame") that grasps vertically in the snow. Its hold in steep slopes is brilliant.

CHD Harsh Irons with Different Saw Teeth

4 steel harsh irons made of 6 spikes are fixed under the frame. Disposed in 4 different directions to offer best grip, in whatever direction you walk.

Front and rear spikes are longer to always find grip in case of icy snow. They are exchangeable.

FreestepLight

Experienced hikers will understand immediately the interest of a smaller frame.

This version is meant for women and men with lighter weight; smaller, handier with exactly the same technology.
