

# Freestep

## Lightness feeling and stability

This alpine snowshoe is perfect for reaching summits. The Natural Step (see previous page) is associated to "metallic saws" or harsh irons and a light double ribbed frame ("perimetric frame") that grasps vertically in the snow. Its hold in steep slopes is brilliant.

1 080 g x 2 45 > 120 kg 34 > 47

### CHD Harsh Irons with Different Saw Teeth

4 steel harsh irons made of 6 spikes are fixed under the frame. Disposed in 4 different directions to offer best grip, in whatever direction you walk.

Front and rear spikes are longer to always find grip in case of icy snow. They are exchangeable.

# FreestepLight

Experienced hikers will understand immediately the interest of a smaller frame.

This version is meant for women and men with lighter weight; smaller, handier with exactly the same technology.
